

SHIMANO SLX M675
SHIMANO XT M785

Due to the shape of these specific SLX/XT 2X spiders, the chain would rub this spider when using the 32T ring. So you have to make a small spacer adjustment for running the 32T. *This is ONLY for the 32T ring on these specific cranks.*

Simply add a 2mm chain ring bolt spacer on all 4 BCD mounts then mount the ring up. Depending on your chain ring bolts, you might have to switch to a longer bolt. Just make sure you have long enough bolts once you added the 2mm spacer.

Once it's installed...it will look like this and now the chain will not run/interfere with the spider.

Again..this is ONLY when using the 32T on these specific Shimano cranks.
