

## **MagicShine Battery Care Tips**

*Please share this with your customers, we have had great reliability with these batteries and this will help your customers achieve a longer battery life.*

*1. Once customers get the new battery, it will have about 20/-30% of capacity within, so, customer can use it until next charge. And the Lithium battery activity can be activated after 2-3 time charging cycles.*

*2. Lithium battery does not have the memory function, so it can be charged before each usage .*

*But customers need to pay more attention that the battery can not be over discharged, otherwise this will cause damages to battery. For example, when the light indicator shows low power, you will need to charge it.*

*3. If you do not use the light for a long time, please disconnect the light head and battery, in order to avoid battery damages.*

*4. Lithium battery working temperature: charging temperature is 0 ℃ ~45 ℃, and working temperature is -20℃ ~60℃.*

*5. Keep the battery positive and negative anodes from metal, otherwise this will cause the battery short out, damage or even fires.*

*6. Please do not knock, soak, refit and solarize the battery, keep it away from the microwave and high temperature atmosphere.*

*7. When you charge the battery, please use the original or other good quality chargers, do not use the larger voltage or non Magicshine chargers.*

*The storage of battery if not to be used for a long time:*

*1. Please try to charge the battery every three months at least 50-80% power capacity, otherwise, battery may be damaged due to over discharge.*

*2. It will be better to keep the battery in 0 ℃ ~20 ℃ dry condition, as the battery capacity will loose under low temperature and high humidity conditions, this will cause damage to battery.*

*3. Please disconnect the light head with battery after cycling in a rain condition, to keep the battery dry.*
